A comment on derivative notation

Power rule

 $f(x) = x^2$ Find f' at x=2 (using the definition of the derivative). $\lim_{h \to 0} h$ $= \lim_{h \to 0} \frac{4 + 4h + h^2 - 4}{h}$ $= \lim_{h \to 0} \frac{4h + h^2}{h} = 4$

Power rule $f(x) = x^2$ Find f' at alt points $x + h^2 - x^2$ time $h \to 0$ h $= \lim \frac{x^2 + 2hx + h^2 - x^2}{2hx^2 + 2hx^2}$ h_{i} $h \rightarrow 0$ $= \lim_{h \to 0} \frac{2hx + h^2}{h} = 2x$

Power rule $f(x) = \overline{x^3}$ $f'(x) = \lim_{h \to 0} \frac{(x+h)^3 - x^3}{h}$ $= \lim \frac{x^3 + 3hx^2 + 3h^2x + h^3 - x^3}{2}$ K $h \rightarrow 0$ $= 3x^{2}$

Power rule

 $f(x) = x^n$

Suppose
$$f(x) = g(x) + k(x)$$

Suppose
$$f(x) = g(x)k(x)$$
 and that
 $g(2) = 3, \ k(2) = 1, \ g'(2) = 2, \ k'(2) = 5.$

(A) 3	
	Try g(x)=x and $k(x)=x^2$.
(B) 10	If f'(x)=g'(x)k'(x) then
(C) 11	$f(x) = (x) (x^2)$ so $f'(x)=(1) (2x)=2x$.
	But f(x)=x ³ and power rule says
(D) 17	$f'(x) = 3x^2$.
	So g'(x)k'(x) can't be right.

What is the correct derivative for f(x)=g(x)k(x)?

$$A(t) = d(t)w(t)$$

Rules for differentiation - summary

- Addition rule:
 - f(x) = g(x) + h(x)
 - f'(x) = g'(x) + h'(x)
- Product rule:
 - f(x) = g(x)h(x)
 - f'(x) = g'(x)h(x) + g(x)h'(x)
- Quotient rule (can be justified once we cover chain rule):
 - $f(x) = g(x) / h(x) = g(x) (h(x))^{-1} < --- apply product and chain rules or$

•
$$f'(x) = [g'(x)h(x) - g(x)h'(x)] / g(x)^2$$

Antiderivatives – going backward If f'(x) = 6x² + 4x – 1, then

(A) f(x) = 12x + 4(B) $f(x) = 2x^3 + 2x^2 - x$ (C) $f(x) = 2x^3 + 2x^2 - x + 2$

(D) $f(x) = 2x^3 + 2x^2 - x + C$

Slopes at each x don't change with vertical shift.

If

following could be $f(x)$?
(A) $f(x) = \frac{1}{n+1}x^{n+1}$
(B) $f(x) = \frac{1}{n+1}x^{n+1} + C$
(C) $f(x) = nx^{n-1}$
(D) $f(x) = nx^{n-1} + C$
(E) $f(x) = x^n + C$

If $f'(x) = x^n$, which of the following could be f(x)? $f(x) = \frac{1}{n+1}x^{n+1}$ (A) $f(x) = \frac{1}{n+1}x^{n+1} + C$ **(B)** $f(x) = nx^{n-1}$ (C) $f(x) = nx^{n-1} + C$ (D) $f(x) = x^n + C$ (E)

This is f'(x). Draw f(x).

Only determined up to a vertical shift.

Position-Velocity-Acceleration

 \odot If x(t) is position as a function of time, \oslash velocity v(t) = x'(t), \oslash acceleration a(t) = v'(t) = x''(t). Constant acceleration a: o v(t) = at + C = at + v₀ $x(t) = a/2 t^2 + v_0 t + D = a/2 t^2 + v_0 t + x_0$

Examples of approximately constant acceleration

Ball dropping near surface of planet
Fireworks

From the 2011 final exam

- 8. (10 points) You are driving down the highway when you see a sleeping moose. You apply the brakes and carefully stop your car 20m away from the animal. While you are looking for your camera the moose wakes up. It instantly charges toward your car at a constant speed of 8m/s. One second later, you start backing away from the moose at a constant acceleration of 2m/s².
 - i. (4 points) Write down a function d(t) that is the distance from your car to the moose where t = 0 indicates the moment when you start backing away.
