- Forced vibrations
 - Newton's 2nd Law with external forcing.
 - Forced mass-spring system without damping away from resonance.
 - Forced mass-spring system without damping at resonance.
 - Forced mass-spring system with damping.
 - Review questions.

• Newton's 2nd Law:

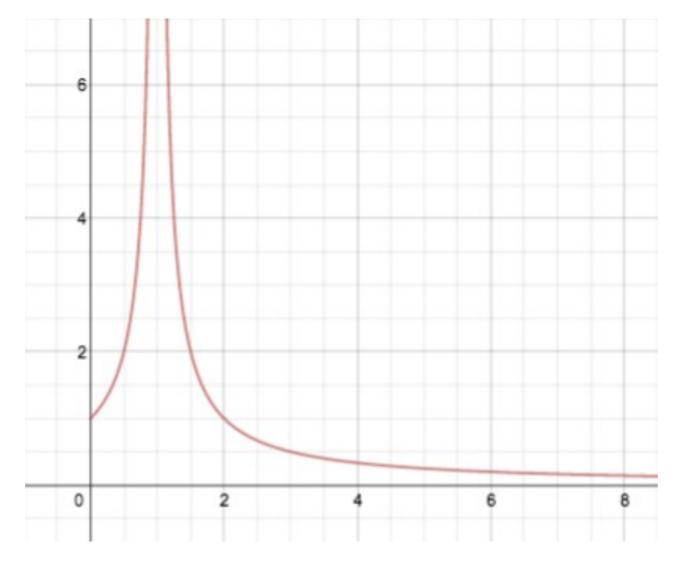

- Forced vibrations nonhomogeneous linear equation with constant coefficients.
- Building during earthquake, tuning fork near instrument, car over washboard road, polar bond under EM stimulus (classical, not quantum).

 \bullet Without damping ($\gamma=0$). $\hfill \ \hfill \ \hfi$ $mx'' + kx = F_0 \cos(\omega t)$ mx'' + kx = 0 $x_h(t) = C_1 \cos(\omega_0 t) + C_2 \sin(\omega_0 t) \qquad \omega_0 = \sqrt[n]{\frac{k}{m}}$ case 1: $\omega \neq \omega_0$ • Case 1: $\omega \neq \omega_0$ natural frequency $x_p(t) = A\cos(\omega t) + B\sin(\omega t)$ $x_p''(t) = -\omega^2 A \cos(\omega t) - \omega^2 B \sin(\omega t)$ $mx_p'' + kx_p = (k - \omega^2 m)A\cos(\omega t) + (k - \omega^2 m)B\sin(\omega t)$ $=F_0\cos(\omega t) \quad \Rightarrow A = \frac{H_0}{\ln(\omega^2 \omega^2 n\omega^2)}, B = 0$

• Case 2:
$$\omega = \omega_0$$
$$mx'' + k_0^2 x = F_0^{F_0} \cos(a(\omega t)t) \qquad \omega_0 = \sqrt{\frac{k}{m}}$$
$$x_p(t) = t(A\cos(\omega_0 t) + B\sin(\omega_0 t))$$
$$x'_p(t) = A\cos(\omega_0 t) + B\sin(\omega_0 t) + t(-\omega_0 A\sin(\omega_0 t) + \omega_0 B\cos(\omega_0 t)) + t(-\omega_0 A\sin(\omega_0 t) + \omega_0 B\cos(\omega_0 t)) + (-\omega_0 A\sin(\omega_0 t) + \omega_0 B\cos(\omega_0 t)) + t(-\omega_0^2 A\cos(\omega_0 t) - \omega_0^2 B\sin(\omega_0 t)))$$
$$A = 0$$
$$B = \frac{F_0}{2\omega_0 m} = \frac{F_0}{2\sqrt{km}} \qquad x_p(t) = \frac{F_0}{2\sqrt{km}} t\sin(\omega_0 t)$$

 \bullet Plot of the amplitude of the particular solution as a function of ω .

• Calculated:

$$A = \frac{F_0}{m(\omega_0^2 - \omega^2)}$$

Plotted:

$$A(\omega) = \frac{1}{|\omega_0^2 - \omega^2|}$$

• Recall that for $\omega = \omega_0$, the amplitude grows without bound.

• With damping (on the blackboard)

<u>Prob. 2.</u> (3 pts.) Here are three *nonlinear* differential equations. Circle *all* the terms that make them *nonlinear*.

(i)
$$y'' + t yy' - y^2 - t^2 = 0$$

(ii) $y' + t \sin(y) = 5 ty$
(iii) $y' + y \sin(t) = 5(ty)^2$

 A dye diffuses between two chambers at a rate proportional to the difference in concentrations (c₁ and c₂) between the chambers (with proportionality constant k>0). Write down a differential equation for the concentration in the first chamber.

$$\frac{dc_1}{dt} = k(c_2 - c_1)$$

• Solve:
$$y' - 2ty = t$$

$$y(t) = Ce^{t^2} - \frac{1}{2}$$

<u>Prob. 2.</u> (6 pts.) Consider the equation for a linear oscillator with frequency = 2:

$$d^{2}y/dt^{2} + 4y = 0$$
: $y(0) = 2$, $y'(0) = 4$.

Express the solution in the form $y = R \cos(2t - \phi)$, i.e. solve this initial value problem and find R and ϕ .

$$y(t) = 2\sin(2t) + 2\cos(2t)$$

$$A = \sqrt{2^2 + 2^2} = 2\sqrt{2}$$

$$y(t) = 2\sqrt{2} \left(\frac{1}{\sqrt{2}}\sin(2t) + \frac{1}{\sqrt{2}}\cos(2t)\right)$$

$$\sin\phi = \frac{1}{\sqrt{2}}, \quad \cos\phi = \frac{1}{\sqrt{2}} \implies \phi = \frac{\pi}{4}$$

$$y(t) = 2\sqrt{2}\cos\left(2t - \frac{\pi}{4}\right)$$

<u>Prob. 2.</u> (6 pts.) Consider the equation for a linear oscillator with frequency = 2:

 $d^{2}y/dt^{2} + 4y = 0$: y(0) = 2, y'(0) = 4.

Express the solution in the form $y = R \cos(2t - \phi)$, i.e. solve this initial value problem and find R and ϕ .

Note that to convert from
$$y(t) = 2\sin(2t) + 2\cos(2t)$$

to a single cos function we used the identity

$$\cos(A+B) = \cos(A)\cos(B) - \sin(A)\sin(B)$$

with $A=2t~~{\rm and}~~B=-\phi~{\rm so}$

$$\cos(2t - \phi) = \cos(2t)\cos(-\phi) - \sin(2t)\sin(-\phi)$$

or equivalently

$$\cos(2t - \phi) = \cos(2t)\cos(\phi) + \sin(2t)\sin(\phi)$$
