## Today

- Shapes of solutions for distinct eigenvalues case.

## Example

- Doc cam:
- $y(t)=C_{1}(1 ; 2) e^{-t}+C_{2}(1 ;-1) e^{t}$
- With ICs
- $y(0)=(2 ; 4)$
- $\mathrm{y}(0)=(2 ; 2)$
- $y(0)=(2 ; 1)$
- Desmos: https://www.desmos.com/calculator/tpelfq4nbe

## Shapes of solution curves in the phase plane

- Which phase plane matches the general solution

$$
\mathbf{x}=C_{1} e^{3 t}\binom{1}{3}+C_{2} e^{-t}\binom{1}{-1} ?
$$

(A)

(E) Explain, please.

## Plotting $x(t) v s y(t)$ compared to $t v s x(t)$

$$
\begin{aligned}
& \binom{x_{1}(0)}{x_{2}(0)}=\binom{4}{-6} \\
& \binom{x_{1}}{x_{2}}=\frac{7}{2} e^{-t}\binom{1}{-2}+\frac{1}{2} e^{3 t}\binom{1}{2} \\
& \xrightarrow[t]{\text { (t) }} \\
& C_{1}=\frac{7}{2}, C_{2}=\frac{1}{2}
\end{aligned}
$$

## Shapes of solution curves in the phase plane

- Simple example to show general idea. $\mathrm{x}^{\prime}=\left(\begin{array}{cc}\lambda_{1} & 0 \\ 0 & \lambda_{2}\end{array}\right) \mathbf{x}$

$$
\begin{array}{lrl}
\mathbf{v}_{\mathbf{1}}=\binom{1}{0} & \frac{1}{\lambda_{2}} \ln \left(\frac{x_{2}}{C_{2}}\right) & =\frac{1}{\lambda_{1}} \ln \left(\frac{x_{1}}{C_{1}}\right) \\
\mathbf{v}_{\mathbf{2}}=\binom{0}{1} & \ln \left(\frac{x_{2}}{C_{2}}\right) & =\frac{\lambda_{2}}{\lambda_{1}} \ln \left(\frac{x_{1}}{C_{1}}\right) \\
\mathbf{x}=C_{1} e^{\lambda_{1} t}\binom{1}{0}+C_{2} e^{\lambda_{2} t}\binom{0}{1} & \ln \left(\frac{x_{2}}{C_{2}}\right) & =\ln \left(\frac{x_{1}}{C_{1}}\right)^{\lambda_{2}} \\
x_{1}(t) & =C_{1} e^{\lambda_{1} t} & t=\frac{1}{\lambda_{1}} \ln \left(\frac{x_{1}}{C_{1}}\right) \\
x_{2}(t) & =C_{2} e^{\lambda_{2} t} & t=\frac{1}{\lambda_{2}} \ln \left(\frac{x_{2}}{C_{2}}\right)
\end{array} x_{2}=C_{2}\left(\frac{x_{1}}{C_{1}}\right)^{\frac{\lambda_{2}}{\lambda_{1}}}
$$

- Can we plot solutions in $x_{1}-x_{2}$ plane by graphing $x_{2}$ versus $x_{1}$ ?

## Shapes of solution curves in the phase plane

- Simple example to show general idea. $\mathbf{x}^{\prime}=\left(\begin{array}{cc}\lambda_{1} & 0 \\ 0 & \lambda_{2}\end{array}\right) \mathbf{x}$
$x_{2}=C_{2}\left(\frac{x_{1}}{C_{1}}\right)^{\frac{\lambda_{2}}{\lambda_{1}}}$
- For the shape of solutions, we need to know the sign and size of $\frac{\lambda_{2}}{\lambda_{1}}$.

$$
\begin{align*}
\lambda_{2} & =\lambda_{1} \\
x_{2} & =C x_{1}
\end{align*}
$$

$$
\begin{aligned}
& \lambda_{2}=\frac{1}{3} \lambda_{1} \\
& x_{2}=C \sqrt[3]{x_{1}}
\end{aligned}
$$

stays near $\mathrm{x}_{2}$ axis

## Shapes of solution curves in the phase plane

- With more complicated solutions (evectors off-axis), tilt shape accordingly.
$\binom{x_{1}}{x_{2}}=C_{1} e^{-t}\binom{1}{-2}+C_{2} e^{3 t}\binom{1}{2}$
- Going forward in time, the blue component shrinks slower than the green component grows so solutions appear closer to blue "axis" than to green "axis"

## Shapes of solution curves in the phase plane

- Which phase plane matches the general solution

$$
\mathbf{x}=C_{1} e^{-3 t}\binom{1}{3}+C_{2} e^{-t}\binom{1}{-1} ?
$$

(B)

(D)
